

Canto releases Cumulus 8

Canto announced the release of Cumulus 8, introducing entirely new digital asset management (DAM) capabilities, and providing the technological foundation required to push the platform even further.

Usage statistics and reporting is among the most noted new features. Customers can now value their assets by knowing which are being used most, and fine-tune their metadata by knowing the search terms users choose.

Cumulus 8 can also catalog assets via email, offering easy, network-secure uploads of photos taken with mobile devices, security cameras, and more.

Performance has been dramatically improved too. For example, Cumulus 7 can assign a metadata set to 40 records in the same time Cumulus 8 assigns the set to over 8,000 records, offering an exponential

boost in productivity potential.

Additional new Cumulus 8 features include:

- * Enhanced collaboration through user commenting.
- * Find files faster with user-defined filters that show only certain formats, approved,
- * Compare multiple assets at once with new full-screen preview.
- * Protect downloaded images with licence-free watermarking, included in all editions.
- * Create image variants from inside Cumulus 8, using built-in Image Editor.

The Cumulus 8 product line has also been updated, offering a new entry-level edition and more affordable network-based licenses for add-ons.
